About This Document

Purpose

This document describes the UPS5000-H-(400 kVA–800 kVA) in terms of its model description, positioning, features, application scenarios, configurations, product architecture, technical specifications, and acronyms and abbreviations.

This document describes the UPS5000-H with the capacity of 400 kVA, 500 kVA, 600 kVA, and 800 kVA.

Intended Audience

This document is intended for:

- Sales engineers
- System engineers
- Technical support engineers

Symbol Conventions

The symbols that may be found in this document are defined as follows.

Symbol	Description	
A DANGER	Indicates a hazard with a high level of risk which, if not avoided, will result in death or serious injury.	
	Indicates a hazard with a medium level of risk which, if not avoided, could result in death or serious injury.	
	Indicates a hazard with a low level of risk which, if not avoided, could result in minor or moderate injury.	

Symbol	Description	
NOTICE	Indicates a potentially hazardous situation which, if not avoided, could result in equipment damage, data loss, performance deterioration, or unanticipated results. NOTICE is used to address practices not related to personal injury.	
	Supplements the important information in the main text. NOTE is used to address information not related to personal injury, equipment damage, and environment deterioration.	

Change History

Changes between document issues are cumulative. The latest document issue contains all updates made in previous issues.

Issue 04 (2022-02-11)

Updated the format of the technical parameter table.

Issue 03 (2021-10-13)

Added the three-phase three-wire model for the 800 kVA UPS in the 380 V AC/400 V AC/415 V AC voltage system.

Issue 02 (2021-08-03)

- Added the top air exhaust feature.
- Added the S-ECO mode.
- Added the 200 V AC, 208 V AC, and 210 V AC voltage systems for the 600 kVA UPS.
- Added the 480 V AC voltage system for the 800 kVA UPS.

Issue 01 (2021-01-30)

This issue is the first release.

1 Product Overview

1.1 Positioning

The UPS5000-H is a high-end modular UPS launched by the Company. It adopts online double conversion and modular redundancy design for components. Thanks to digital control, the UPS provides high efficiency and power density.

The UPS5000-H provides reliable, efficient, and simple solutions. It supplies reliable and high-quality power to:

- Large-sized data centers
- ISP data centers
- Internet data centers
- DR data centers
- Cloud data centers
- Infrastructures, large-sized control equipment rooms, and railways

1.2 Features

Simple

- Power, bypass, and control modules are hot swappable. A common engineer can finish maintenance within 5 minutes.
- Smooth capacity expansion is supported. The initial investment on the UPS is reduced and the UPS operating efficiency is improved.
- The UPS is configured with an SNMP card, which reduces the management cost and features simple and flexible configurations. The NetEco easily implements remote centralized management.
- The power supply and distribution status is monitored in real time. Core parameters of the UPS power supply and distribution system are automatically inspected, so manual inspection is not required.

Green

- Space is efficiently used. The UPS saves space for placing more IT equipment and reduces the footprint by 50% compared with traditional solutions of combining cabinets.
- The power density of power modules is the highest in the industry.
- High efficiency is ensured even with a low load rate. If the load rate is extremely low, the intelligent rotation hibernation technology ensures redundancy and improves the UPS efficiency.

Intelligent

The iPower fault warning function is supported. If a battery, capacitor, fan, or any other key component fails, a warning is generated to prevent the fault from escalating.

Safe

- UPS power and control modules use redundant design. No single-point fault occurs.
- The product supports a wide input voltage range to adapt to poor power grids.
- The UPS has an output power factor (PF) of 1.0, which is suitable for linear and non-linear loads with a PF greater than 0.5. This allows the UPS to connect to more loads and reduces customer investments.
- The UPS passes reliability tests which focus on high temperature, high humidity, and dust adaptation. The impact of environment on the UPS reliability is reduced.

1.3 Application Scenarios

The UPS5000-H is suitable for power systems in various indoor scenarios, including large-sized data centers or communications centers, equipment rooms of large-sized enterprises, equipment rooms of financial systems, industrial automated equipment, and scheduling centers.

Table 1-1	Typical	UPS	configurations
-----------	---------	-----	----------------

Configuration	Application Scenario	Description
Single UPS	Supplies power to common loads.	-

Configuration	Application Scenario	Description
Parallel system	Supplies power to large-sized data centers or important loads. It features high reliability and strong transient overload resistance capability.	 380 V AC/400 V AC/415 V AC voltage system: Four UPSs can be connected in parallel for all models. 200 V AC/208 V AC/210 V AC voltage system: Two UPSs can be connected in parallel only for the 600 kVA three-phase four-wire model. 480 V AC voltage system: A single UPS is supported only for the 800 kVA three-phase four-wire model.
Multi-bus system	Supplies power to important loads in large- and medium-sized equipment rooms, data centers, and other places that require high reliability. In addition to advantages of common parallel systems, the multi-bus system is free from bottleneck failures, but its configuration is complex.	Dual-bus supported

D NOTE

For the three-phase four-wire model, if the mains and bypass use different power sources, ensure that the neutral wires of the mains and bypass input power sources are equipotential. For example, the mains and bypass inputs are from the same transformer.

Single UPS

The UPS uses a modular design. It uses multiple power modules connected in parallel to deliver a high loading capacity. If one power module is faulty, other power modules continue working. If loads are light, the UPS provides redundant capacity even if only a single UPS is operating, which ensures high reliability.

Figure 1-1 Typical application scenario of a single UPS

Parallel System

In a parallel system, mains input, bypass input, and AC output terminals of UPSs are connected in parallel. Energy control modules (ECMs) on different UPSs are connected over parallel cables to synchronize UPS outputs to supply power to loads. If one UPS fails, another UPS continues supplying power to loads, which ensures system reliability.

Figure 1-2 Typical application scenario of 1+1 parallel system

Dual-Bus System

A dual-bus system consists of two independent UPS systems. Each UPS system consists of one UPS or multiple UPSs connected in parallel. Of the two UPS systems,

one is the master system and the other is the slave system. The dual-bus system is highly reliable and is suitable for loads with multiple input terminals. You can install an optional static transfer switch (STS) to start a bus synchronization controller (BSC) provided in standard configuration. The UPS systems work in inverter mode or bypass mode.

Figure 1-3 Typical application scenario of a dual-bus system consisting of single UPS systems

1.4 Working Principle

The UPS is an online product. It uses modular design, which facilitates maintenance and capacity expansion. Intelligent control is adopted for modules. The power module consists of a rectifier, inverter, and DC/DC converter. The product converts inputs into pure high-quality sine wave outputs by using the high-frequency switching technology.

Figure 1-4 Conceptual diagram

1.5 Working Modes

1.5.1 Normal Mode

In normal mode, the rectifier converts AC power into DC power. Then the inverter converts DC power into AC output. At the same time, the rectifier charges batteries over a charger. The two conversions ensure high-precision and high-quality output voltages, protecting loads from interferences such as input harmonics, glitches, and voltage transients.

Figure 1-5 UPS conceptual diagram in normal mode

1.5.2 Bypass Mode

When the UPS detects that the power module experiences overtemperature, overload, or other faults that may shut down the inverter, the UPS automatically transfers to bypass mode. At the same time, the rectifier is started and charges batteries over a charger. In bypass mode, loads are powered by the bypass module. The bypass power supply is not protected by the UPS and therefore is prone to the mains outage, abnormal AC voltage waveform, or abnormal frequency.

Figure 1-6 UPS conceptual diagram in bypass mode

1.5.3 Battery Mode

If the mains input is abnormal or the rectifier becomes abnormal, the UPS transfers to battery mode. The power module obtains energy from batteries, and the energy is converted into AC output by the inverter.

Figure 1-7 UPS conceptual diagram in battery mode

1.5.4 S-ECO Mode

D NOTE

- Only the three-phase four-wire 380 V AC/400 V AC/415 V AC (line voltage) model supports the super economy control operation (S-ECO) mode.
- The system can work in S-ECO mode only when the hardware of both the power module and bypass module supports the S-ECO mode.
- If the hardware of the existing power module or bypass module does not support the S-ECO mode, the ECO mode is displayed (2–5 ms interruption may occur during the transfer of this traditional ECO mode). If the UPS works in S-ECO mode but the hardware of the power module or bypass module is changed and does not support the S-ECO mode, a dialog box is displayed, indicating that the hardware does not support the S-ECO mode. After you click **OK**, the UPS works in ECO mode.

S-ECO is a working mode that combines the economy control operation (ECO) mode and inverter mode. In S-ECO mode, the UPS directly supplies power to loads through the bypass and automatically determines whether to compensate for load harmonics based on load conditions to achieve higher efficiency. It ensures uninterruptible (0 ms) power supply and reduces the impact of load harmonics on the power grid. This mode can be set on the LCD or WebUI.

- When the bypass input voltage waveform is good (the voltage and frequency are within the preset bypass range, the PF is greater than 0.5, and the load rate is greater than 15%), the UPS works in bypass mode preferentially and the inverter starts for hot backup to achieve 0 ms transfer. When the load harmonic is greater than the preset value, the inverter output compensates for the harmonic component in the load.
- If the bypass input voltage waveform is poor (the voltage and frequency exceed the preset bypass range, the PF is less than 0.5, or the load rate is less than 15%), the UPS works in inverter mode preferentially.
- In either bypass mode or inverter mode, the rectifier is started all the time and charges batteries using a charger.

Figure 1-8 UPS conceptual diagram in S-ECO mode

D NOTE

Manual startup is required to ensure that the inverter is in standby state and the power flow has reached the load side through the inverter.

1.5.5 ECO Mode (The System Can Work in ECO Mode If the Model or Hardware Does Not Support S-ECO)

The ECO mode is an economy working mode, which can be configured on the LCD or web user interface (WebUI). In ECO mode, when the bypass input is within the ECO voltage and frequency ranges and other ECO power supply conditions are met, the UPS works in bypass mode and the inverter is in standby state. When the bypass source voltage is outside the ECO voltage range, the UPS transfers from bypass mode to inverter mode. In either bypass mode or inverter mode, the rectifier is started all the time and charges batteries using a charger. The ECO mode delivers a high efficiency.

Figure 1-9 UPS conceptual diagram in ECO mode

D NOTE

Manual startup is required to ensure that the inverter is in standby state and the power flow has reached the inverter.

1.5.6 Source-Share Mode

If the UPS works properly and the AC input power of rectifiers is insufficient, the UPS transfers to source-share mode. In this case, the power module obtains energy from both the mains and batteries, and the energy is converted into AC outputs by the inverter.

Figure 1-10 Conceptual diagram in source-share mode

2 Product Introduction

2.1 Model Description (Three-Phase Four-Wire)

Figure 2-1 Model number (600K is used as an example)

No.	ltem	Description	
1	Product category	UPS5000	
2	Product subcategory	H: high power density and high efficiency	
3	Rated capacity	 800K: The output capacity is 800 kVA. 600K: The output capacity is 600 kVA. 500K: The output capacity is 500 kVA. 400K: The output capacity is 400 kVA. 	
4	Switch configuration	N: no switch	
5	Cabling	 T: Cables are routed in and out from the top. NOTE If the system is not configured with optional components, cables can be routed in and out from the top. If a bottom cabling cabinet is configured, cables can be routed in and out from the bottom.

3 Component Description

3.1 Power Module

The power module consists of a power factor correction (PFC) rectifier and inverter. It performs AC/DC or DC/DC conversion on the mains and battery inputs, and stabilizes the bus voltage. The inverter (DC/AC) converts the inputs into sine wave outputs.

Figure 3-1 Appearance

Table 3-1 Indicator description

Indicator	Color	Status	Description
Running	Green	Steady on	The system is working in inverter mode.

Indicator	Color	Status	Description
indicator		Blinking at long intervals	• The inverter is ready and in standby state (blinking at 0.5 Hz, on for 1s and off for 1s).
			• The inverter is not started (blinking at 0.2 Hz, on for 2.5s and off for 2.5s).
		Blinking at short intervals	The module is not configured, the inverter software and rectifier software are being upgraded, or the inverter software is being upgraded (blinking at 4 Hz, on for 0.125s and off for 0.125s).
		Off	The software is being upgraded.
Alarm indicator	Yellow	Steady on	A minor alarm is generated for the inverter or rectifier.
		Off	There is no minor alarm for the inverter or rectifier, or the software is being upgraded.
Fault indicator	Red	Steady on	A critical alarm is generated for the inverter or rectifier.
		Off	There is no critical alarm for the inverter or rectifier, or the software is being upgraded.

Table 3-2 Specifications

Item	Specifications	
Rated output capacity	 200 V AC/208 V AC/210 V AC voltage system: 50 kVA/50 kW 380 V AC/400 V AC/415 V AC/480 V AC voltage system: 100 kVA/100 kW 	
Dimensions (H x W x D)	130 mm x 442 mm x 750 mm	
Weight	< 55 kg	

3.2 Bypass Module

The UPS supplies power through the bypass under the following circumstances:

- The S-ECO or ECO mode is used and the bypass voltage is within the specified range.
- The power module overload times out.
- Both active and standby energy control modules (ECMs) in the system are abnormal.
- The system runs abnormally.
- The power supply is switched is to the bypass manually.

Figure 3-2 400–600 kVA bypass module

Figure 3-3 800 kVA bypass module

Indicator	Color	Status	Description
Running indicator	Green	Steady on	Power is supplied through the bypass.
		Blinking at long intervals	The bypass has no output (blinking at 0.2 Hz, on for 2.5s and off for 2.5s).
		Blinking at short intervals	The bypass is not configured or the software is being upgraded (blinking at 4 Hz, on for 0.125s and off for 0.125s).
		Off	The bypass software is being upgraded.
Alarm indicator	Yellow	Steady on	A minor alarm is generated for the bypass.
		Off	There is no minor alarm for the bypass, or the software is being upgraded.
Fault indicator	Red	Steady on	A critical alarm is generated for the bypass.
		Off	There is no critical alarm for the bypass, or the software is being upgraded.

Table 3-4 Specifications

Item	Specifications	
Dimensions (H x W x D)	 400-600 kVA: 200 mm x 600 mm x 600 mm 800 kVA: 500 mm x 480 mm x 550 mm 	
Weight	 400-600 kVA: ≤ 50 kg 800 kVA: ≤ 83 kg 	

3.3 Control Module

3.3.1 Overview

The control module in a standard configuration contains two ECMs, one dry contact card, and one monitoring interface card from left to right. The four cards are hot-swappable. One subrack is reserved above the dry contact card. A backfeed protection card or dry contact extended card can be inserted into the subrack.

18 16 15 14 13 00 10 11 12 UA10000059 (1) Ground terminal (2) Parallel port 1 (4) Ready switch on (3) BSC ECM 1 port 1 (5) ECM 1 indicators (6) Parallel port 2 (7) BSC (8) Ready switch on port 2 ECM 2 (9) ECM 2 indicators (10) Dry contact (11) Dry (12) Monitoring display unit (MDU) card contacts port (13) RS485 port (14) FE port (15) COM2 (16) COM1 port port (17) Battery (18) Optional card subrack temperature sensor port cover

Figure 3-4 Signal panel of the control module

Ports are protected by a security mechanism.

3.3.2 ECM

- As a control interface for the entire system, the ECM communicates with each module and provides a bus for communication between the dry contact card and the system control card. The ECM ensures equalized output currents between modules so that load power is equally shared.
- The ECM provides module working status information to the monitoring system.
- The ECM controls the running of a single UPS and a parallel system, and reports the UPS status information to other monitoring modules.

- The system provides three types of CAN communication: monitoring CAN communication, intra-rack parallel CAN communication, and inter-rack parallel CAN communication.
- The control module consists of one active ECM and one standby ECM.
- Hot-swappable, 1 U high.

Figure 3-5 Appearance

Table 3-5 Port description

Silk Screen	Description
PARALLEL	The PARALLEL port transmits parallel signals between racks.
BSC	The BSC port is used in a dual-bus system to synchronize output frequencies and phases between UPS systems, ensuring that two buses can switch with each other. BSC cables are hot-swappable.

NOTE

No parallel cable is required for a single UPS.

Table 3-6 Indicator description

Indicator	Color	Status	Description
NORMAL	Green	Steady on	This ECM is the active ECM.
		Blinking at 0.5 Hz	This ECM is the standby ECM and it is ready.
		Off	This ECM is not ready or the software of this ECM is being upgraded.
		Blinking at 4 Hz	The ECM software is being upgraded or not configured.

Indicator	Color	Status	Description	
ALM	Yellow	Steady on	The ECM has a minor alarm, but it does not need to be replaced.	
		Off	The ECM has no minor alarm or the software of the ECM is being upgraded.	
FAULT	Red	Steady on	The ECM has a critical alarm.	
		Off	The ECM has no critical alarm or the software of the ECM is being upgraded.	

Figure 3-6 CAN communication logic

3.3.3 Dry Contact Card

The dry contact card allows the UPS to detect and manage the switch status of the battery system (including the external battery switch) and implement remote emergency power off (EPO). The dry contact card is 0.5 U high and hot-swappable.

NOTICE

- A dry contact card port takes effect only after you set it in the software. You need to disable unused dry contact signals.
- Set the EPO port to normally open (NO) or normally closed (NC) as required.
- If multiple UPSs are connected in parallel, connect all used dry contact signals to each UPS.
- Signal cables must be double-insulated twisted cables. If the cable length is within 25–50 m, the cross-sectional area must be 0.5–1.5 mm².
- For dry contact outputs, the rated DC voltage and current are 24 V DC and 0.6 A and the maximum values are 30 V DC and 1.0 A. The rated AC voltage and current are 24 V AC and 0.6 A and the maximum values are 30 V AC and 1.0 A. During cable connection, ensure that the voltage and current do not exceed these maximum values.

Figure 3-7 Appearance

Silk Screen	Signal Description	Status Description Initial Status
BTG	Port for monitoring battery grounding failures	• Closed: There is Open ^a a battery

SWITCH STATUS_0V	Port for signal ground	circuit breaker is ON.	
		 Open: The bypass input circuit breaker is OFF. 	
SPD	Port for monitoring the input AC SPD	 Closed: The input AC SPD is normal. 	Closed ^a
0V	Port for signal ground	 Open: The input AC SPD fails. 	

a: On the LCD, choose System Info > Settings > System Settings > Dry Contact Set > MUE05A DI type configure, and customize the initial status of Battery ground fault [BTG], D.G. connection [GEN], PDC output breaker [OUT], PDC maintenance breaker [MT], BP/SYSMT switch, and SPD/SYSOUT switch.

3.3.4 Monitoring Interface Card

The monitoring interface card provides external ports as well as monitoring and control functions for the monitoring display unit (MDU). The monitoring interface card provides the ambient temperature and humidity sensor port, FE port, battery temperature monitoring port, and network management port. The MDU monitors the UPS, allows users to set parameters, delivers commands, reports system information, and displays key UPS information and parameters on the LCD.

NOTICE

- The FE port resembles the RS485 port. Therefore, follow the silk screens when you connect communications cables. If you mistake the RS485 port as the FE port during cable connection, the WebUI communication fails. If you mistake the FE port as the RS485 port during cable connection, RS485 communication fails.
- Dry contact signals take effect after you set them. Disable unused dry contact signals on the monitoring system.
- When multiple UPSs are connected in parallel, all dry contact signals to be used need to connect to each UPS.

Figure 3-8 Monitoring interface card

D NOTE

DO_1 to DO_4 meet the maximum voltage and current requirements of 30 V DC/1 A or 60 V DC/0.5 A.

Port	Silk Screen	Description
DO_1	NO	• DO_1, DO_2, DO_3, and DO_4 indicate
	СОМ	alarm outputs. The default values are Critical alarm, Minor alarm, Bypass mode,
DO_2	NO	and Battery mode , respectively.
	СОМ	 On the LCD, choose System Info > Settings > System Settings > Dry Contact Set. Set MUS05A DO_1, MUS05A DO_2, MUS05A DO_3, and MUS05A DO_4 to Disable, Critical alarm, Minor alarm, Bypass mode, Battery mode, Low batt.
DO_3	NO	
	СОМ	
DO_4	NO	

Port	Silk Screen	Description
	COM	volt., Batt. SOC below thres., Abnormal mains, Sys maint breaker enable, Sys outp breaker enable, Maint. breaker closed, No power supplied, Mains supplies power, ECO mode, Battery test, Batt. volt. below thres, Rack output overload, Battery temp. abnormal, and Battery EOD.
		 Configure power segment settings based on backup time.
DB26	MDU	Supports FE, RS485, I2C, CAN, and other signals.
Battery temperature sensor port	B_TEMP	Connects to an indoor battery temperature sensor.
Southbound communications port 1	COM1	 Supported protocol: Modbus-RTU Connects to an ambient temperature and humidity sensor over two wires.
Southbound communications port 2	COM2	Supported protocol: Modbus-RTUConnects to a southbound device.
Network port	FE	 Supported protocols: Modbus-TCP, HTTPS, and SNMP Connects to the network port on a PC. Network port for connecting to the web service and for SNMP networking
Northbound communications port	RS485	 Supported protocol: Modbus-RTU Connects to a northbound network management device or third-party network management device over two wires.

- Signal cables must be double-insulated twisted cables. If the cable length is within 25–50 m, the cross-sectional area must be 0.5–1.5 mm².
- RS485 cables and FE cables must be shielded cables.

Figure 3-9 and Figure 3-10 are recommended wiring methods for DO ports.

NOTE

If cables are prepared onsite, follow the three methods below:

- Connect pin 1 and pin 2. Pin 1 connects to RS485+ and pin 2 connects to RS485-.
- Connect pin 4 and pin 5. Pin 4 connects to RS485+ and pin 5 connects to RS485-.
- Connect pins 1, 2, 4, and 5. Twist cables to pin 1 and pin 4 into one cable and then connect it to RS485+. Twist cables to pin 2 and pin 5 into one and then connect it to RS485–.

3.4 MDU

The MDU allows you to control UPS operations, view the running status and alarms, and set parameters.

Dimensions (H x W x D): 175 mm x 264 mm x 40 mm

Figure 3-14 Appearance

(2) LCD touchscreen

Table 3-12 Indicator status

Status	Color	Meaning	
On	Red	A critical alarm has been generated, and the buzzer sounds continuously.	
	Yellow	A minor alarm has been generated, and the buzzer buzzes intermittently at 2 Hz.	
	Green	The UPS is running properly or a warning has been generated.	
Off	-	The MDU is powered off.	

The indicator on the MDU panel is yellow when the bypass supplies power in non-ECO mode.

Figure 3-15 MDU ports

Table 3-13 MDU port description

No.	Port Name	Description	
1	MUS05A (DB26)	Connects to the MDU and monitoring interface card.	
2	GE	Network port	
3	CAN	Reserved	
4	RS485_1	Reserved	
5	FE_1	Reserved	
6	FE_2	Reserved	
7	USB Host	 After installing the WiFi module, locally connect to the UPS over the Service Expert app. Obtain the initial startup password during deployment. View or obtain UPS running information during inspection. NOTE The user must be a technical support engineer. To ensure security, remove the WiFi module immediately after use. 	
		 Insert a USB flash drive to import and export configuration files, export run logs, and upgrade software. 	
8	SD	Reserved	
9	DIP switch	Implements specific functions by using the DIP switch and specific buttons; controls the CAN communication build-out resistor in a parallel system.	

4 Optional Components

4.1 List of Optional Components

Optional Component	Model	Function
BCB box (only for lead-acid batteries)	 PDU8000-040 0DCV8-BXA00 1 PDU8000-063 0DCV8-BXA00 1 PDU8000-080 0DCV8-BXA00 1 	Controls the connection between battery strings and the UPS, and supports overload protection, short circuit protection, and remote trip control.
Dry contact extended card	-	Provides extended monitoring ports: five relay output ports and five input ports.
Backfeed protection card	-	Detects mains and bypass backfeed and provides protection.
ECM extended subrack	-	Installed when the UPS is equipped with a backfeed protection card and dry contact extended card.
Intelligent detection card	-	 Detects the temperatures of UPS input and output wiring terminals. Used for the optional switch cabinet to detect the temperatures of the input and output wiring terminals and the status of each switch in the cabinet.
Surge protection box	-	Improves the UPS surge protection capability.

Optional Component	Model	Function	
Surge protection box subrack	-	Installed when a surge protection box is used.	
Ambient temperature and humidity sensor	-	Monitors ambient temperature and humidity.	
Battery temperature sensor	-	Monitors the battery temperature.	
BSC cable	10 m/15 m/60 m	Transmits bus synchronization signals in a dual-bus system.	
Parallel cable	5 m/10 m/15 m	Connects UPSs in parallel.	
Bottom cabling cabinet	-	Applies to the bottom cabling scenario.	
Rear copper bar protection component	-	Protects copper bars at the rear of the cabinet.	
Top outlet kit	-	Applies to the top air-flow scenario.	
Inductor cabinet	-	The three-phase three-wire system can be implemented by deploying an inductor cabinet. Currently, only the 800 kVA model supports this feature.	

D NOTE

The ECM extended subrack, surge protection box subrack, intelligent detection card, and top outlet kit do not support onsite installation. If you require any of these components, specify the requirement when you purchase the UPS so that they will be installed before delivery.

4.2 Dry Contact Extended Card

The dry contact extended card provides five groups of electric relay output ports for dry contact signals and five groups of signal input ports to implement various alarm and control functions as required.

A maximum of one dry contact extended card supported in the power monitoring subrack. The card is hot swappable.

Figure 4-1 Appearance

NOTICE

For dry contact outputs, the rated DC voltage and current are 24 V DC and 0.6 A and the maximum values are 30 V DC and 1.0 A. The rated AC voltage and current are 24 V AC and 0.6 A and the maximum values are 30 V AC and 1.0 A. During cable connection, ensure that the voltage and current do not exceed these maximum values.

Port		Silk Screen	Signal Description
Output	DO_1	NO	Indicates relay output signals. The dry
		СОМ	contact is normally open by default. When the preset status occurs, the relay is closed.
	DO_2	NO	Users can set the dry contacts to normally open or closed based on actual
		СОМ	requirements.
	DO_3	NO	 On the LCD, choose System Info > Settings > System Settings > Dry Contact
		СОМ	Set. Set MUE07A DO_1, MUE07A DO_2,
	DO_4	NO	MUE07A DO_3, MUE07A DO_4, and MUE07A DO_5 to Disable , Critical alarm ,
		СОМ	Minor alarm, Bypass mode, Battery mode,
	DO_5	NO	Low batt. volt., Batt. SOC below thres., Abnormal mains, Sys maint breaker
		СОМ	 enable, Sys outp breaker enable, Maint. breaker closed, No power supplied, Mains supplies power, ECO mode, Battery test, Batt. volt. below thres, Rack output overload, Battery temp. abnormal, and Battery EOD. MUE07A DO_1 is set to Low batt. volt. by default. Others are reserved by default. DOs transmit passive dry contact output signals. Users need to connect external power supply to DOs.

Table 4-1 Port definitions for the dry contact extended card

Port		Silk Screen	Signal Description
Input	DI_1	+	All DIs are reserved.
		-	 On the LCD, choose System Info > Settings > System Settings > Dry Contact
	DI_2	+	Settings > System Settings > Dry Contact Set and set MUE07A DI_1-MUE07A DI_5 to
		-	values such as Door alarm and Water alarm. The default value is None .
	DI_3	+	• DI ports detect input dry contact signals
		-	which are passive signals.
	DI_4	+

feedback protection)	MFP_COM	backfeed protection. NO and COM are normally open contacts. NC and COM are normally closed	
	MFP_NC	contacts. When a backfeed occurs, the normally open contacts are closed and the normally closed contacts are open.	
BFP (bypass	BFP_NO	The BFP port is the signal port for the bypass	
feedback protection)	BFP_COM	backfeed protection. NO and COM are normally open contacts. NC and COM are normally closed	
	BFP_NC	contacts. When a backfeed occurs, the normally open contacts are closed and the normally closed contacts are open.	
RSV	RSV_NO	Reserved	

Port Position	Silk Screen	Signal Description
(reserved)	RSV_COM	
	RSV_NC	

4.4 Intelligent Detection Card

In the integrated UPS solution, the intelligent detection card detects the temperatures of the copper bars, switches, and environments of the battery, bypass input, mains input, output, bypass input of the switch cabinet, mains input of the switch cabinet, and output of the switch cabinet, and monitors the status of the mains input, bypass input, and output switches of the switch cabinet.

It is 1 U high and supports hot swap.

4.7 Ambient T/H Sensor

The ambient temperature and humidity (T/H) sensor monitors the ambient temperature and humidity in the equipment room to ensure that the equipment works properly.

The ambient T/H sensor can also be used as a battery temperature sensor. The monitoring module distinguishes these two types of sensors through their DIP switch settings.

The RS485 communications port of the T/H sensor is an RJ11 (6P6C) port. If multiple T/H sensors need to be cascaded, connect the RJ11 port on each T/H sensor.

4.11.1 Rectifier

A rectifier converts AC input power into stable DC power for the fan in the inductor cabinet.

Figure 4-17 Appearance

 Table 4-10 Indicator description

Indicator	Color	Status	Description
Power indicator	Green	Steady on	The rectifier has an AC input.
		Off	There is no AC input.
			The rectifier is faulty.
		Blinking at 0.5 Hz	Querying is in progress.
		Blinking at 4 Hz	The rectifier is loading an application program.
Alarm indicator	Yellow	Off	The rectifier has no protection alarm.
		Steady on	• The rectifier has generated a warning due to ambient overtemperature.
			• The rectifier has generated a shutdown alarm for protection due to ambient overtemperature or undertemperature.

Indicator	Color	Status	Description
			AC input overvoltage or undervoltage protection has been triggered.
			The rectifier is hibernating.
		Blinking at 0.5 Hz	The communication between the rectifier and the external equipment is interrupted. (When rectifiers are used in an inductor cabinet, they do not need to communicate with external devices. It is normal that the alarm indicator blinks at 0.5 Hz.)
Fault indicator	Red	Off	The rectifier is normal.
		Steady on	The rectifier locks out due to output overvoltage.
			The rectifier has no output due to an internal fault.

Output	Voltage imbalance:	±1%							
voltage imbalance	Phase imbalance: 12	Phase imbalance: 120±1° (balanced load and unbalanced load)							
Inverter	Inverter overload capability for front-to-back airflow:								
overload capability	 105% < load ≤ 1² temperature ≤ 30 	10%: transfers to l 0°C)	oypass mode a	fter 60 min or l	onger (ambient				
	 100% < load ≤ 110%: transfers to bypass mode after 60 min or longer (ambient temperature > 30°C) 								
	• $110\% < \text{load} \le 125\%$: transfers to bypass mode after 10 min or longer								
	 125% < load ≤ 150%: transfers to bypass mode after 1 min or longer 								
	 Load > 150%: The inverter can run for 200 ms or longer and withstand at lea 50 shocks. Inverter overload capability for top airflow: 100% < load ≤ 110%: transfers to bypass mode after 60 min or longer 110% < load ≤ 125%: transfers to bypass mode after 10 min or longer (ambie temperature ≤ 30°C) 								
	 110% < load ≤ 125%: transfers to bypass mode after 1 min or longer (ambient temperature > 30°C) 								
	 125% < load ≤ 150%: transfers to bypass mode after 1 min or longer (ambient temperature ≤ 30°C) 								
	 125% < load ≤ 150%: transfers to bypass mode after 20 seconds or more (ambient temperature > 30°C) 								
	 Load > 150%: transfers to bypass mode after 200 ms or more; withstands at least 50 shocks 								
	Continuous overload interval: The preceding overload time is allowed again only 10 min after the system exits the overload state.								
Inverter output short-circuit capability	If the initial load rat twice the rated curr		, the inverter c	output short-circ	uit can tolerate				

ltem	UPS5000-H-400K /500K/600K-NT	UPS5000-H-60 0K-NT	UPS5000-H -800K-NT	UPS5000-H- 800K-NTN	UPS5000-H-8 00K-NT	
Bypass overload capability	400 kVA: At 40°C, runs 60 min at 110% load, 10 min at 125% load, 1 min at 150% load, and 100 ms at over 150% load. 500 kVA/600 kVA: At 25°C, runs continuously at 125% load; generates only alarms and depends on overtemperature protection at 150% load. Note: Except for the three-phase is 150%		generates on overtemperation load. At 40°C: runs generates on overtemperation load.	••••••	lepends on at 135–150% t 125% load; lepends on at 125–150% phase or	
	three-phase is 150%–200%, the bypass will be shut down in 5 min, and the hardware depends on overtemperature protection. If the load of the bypass single-phase or three-phase is greater than 200%, the bypass will be shut down in 1 min, and the hardware depends on overtemperature protection.					

5.8 System Electrical Specifications

Item	Specifications
Parallel system reliability	Redundant parallel signals
ECO in a parallel system	Supported
Number of parallel UPSs	380 V AC/400 V AC/415 V AC voltage system: Four UPSs can be connected in parallel for all models.
	200 V AC/208 V AC/210 V AC voltage system: Two UPSs can be connected in parallel only for the 600 kVA three-phase four-wire model in standard configuration.
	480 V AC voltage system: A single UPS is supported only for the 800 kVA three-phase four-wire model.

Table 5-11 System electrical specifications

Item	Specifications
Power distribution system	TN-C, TN-S, TN-C-S, TT
	NOTE The three-phase three-wire corner-grounded delta power system is not supported.

Function

A lifting trolley is used as an auxiliary tool for replacing a power module or bypass module.

It is recommended that a lifting trolley be configured for each site to facilitate the maintenance of power modules and bypass modules. You can decide whether to choose it based on site requirements.

Appearance

Figure A-1 Lifting trolley

Specifications

ltem	Specifications	
Weight	115 kg	
Load-bearing capacity	350 kg	
Minimum height	360 mm	
Maximum height	1580 mm	
Tabletop dimensions (length x width)	900 mm x 700 mm	

Usage

- Overloading is prohibited.
- Keep hands or feet away from the coverage area of the tabletop.
- When placing a module, brake the lifting trolley to prevent it from moving.
- Keep the lifting trolley properly for future maintenance.
- Step 1 Release the brake of the lifting trolley and push the trolley to the required position.
- Step 2 Brake the lifting trolley to stop it and check that it will not move.
- Step 3 Repeatedly step on the elevating pedal to raise the tabletop to a proper height.
- Step 4 Lift the lowering switch to slowly lower the tabletop to the required height. ----End

B Acronyms and Abbreviations

Α	
AWG	American wire gauge
В	
BSC	bus synchronization controller
BCB-BOX	battery circuit breaker box
BBB-BOX	battery bus bar box
C	
CE	Conformite Europeenne
E	
ECO	economic control operation
EPO	emergency power off
ECM	energy control module
EOD	end of discharge
I	
IEC	International Electrotechnical Commission
L	Commission
LCD	liquid crystal display
M	
MDU	monitoring display unit
P	
PE	protective earthing
	protective carding

PDU	power distribution unit
R	
RS485	Recommended Standard 485
S	
SOC	state of charge
STS	static transfer switch
SNMP	Simple Network Management Protocol
S-ECO	super economy control operation
т	
THDi	total distortion of the input current waveform
THDv	total harmonic distortion of output voltage
U	
UPS	uninterruptible power system
USB	Universal Serial Bus
V	
VRLA	valve-regulated lead acid battery
VFI	voltage frequency independent
VFD	voltage frequency dependent
VI	voltage independent
